   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score

                                                                                                                                                                                                                                                                                                                                                      FUNCTION: Growth factor active in angiogenesis, vasculogenesis are endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Fit-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin. Neuropillin-1 binds isoforms VEGF-165 and VEGF-145. SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer with PIGF (By similarity).
                                                                                                                                                                                      VEGF165 is more basic, has heparin-binding properties and, although a signicant proportion remains cell-associated, most freely secreted. VEGF189 is very basic; it is cell-associated after secretion and is bound avidly by heparin and the extracellular matrix, although it may be released as a soluble form by heparin, heparinase or plasmin.
                                                                                                                                                                  form by heparin, heparing ALTERNATIVE PRODUCTS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It blnds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin (By similarity).

SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer with PlGF (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SIMILARITY: BELONGS TO THE PDGF/VEGF FAMILY OF GROWTH FACTORS

FUNCTION: Growth factor active in angiogenesis, vascuendothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apopinduces permeabilization of blood vessels. It binds to VEGFR1/Fit-1 and VEGFR2/Kdr receptors and to heparan

Name=VBCF-2; Synonymes-VEGF120;

IsoId-000731-3; Sequence=VSP 004628;

IsoId-000731-3; Sequence=VSP 004628;

TISSUE SPECIFICITY: In developing embryos, expressed mainly in technoid plexus, paraventricular neuroepithelium, placenta and kidney glomeruli. Also found in bronchial epithelium, adrenal gland and in seminiferous tubules of testis. High expression of VBCGF continues in kidney glomeruli and choroid plexus in adults.

DOMAIN: VEGF-3 contains a basic insert which acts as a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Biol. Chem. 271:3877-3883(1996).

FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibite apoptosis, and proliferation, promotes cell migration. It binds to the induces permeabilization of blood vessels. It binds to the

"Characterization and expression of vascular endothelial growth
factor (VEGF) in the ovine corpus luteum.";
J. Reprod. Fertil. 108:157-165(1996).
-i- FUNCTION: Growth factor active in angiogenesis, vasculogenesis and
endothelial cell growth. It induces endothelial cell
proliferation, promotes cell migration, inhibits apoptosis, and
induces permeabilization of blood vessels. It binds to the
VEGFR1/Fit-1 and VEGFR2/Kdr receptors and to heparan sulfate and

"pituitary follicular cells secrete a novel heparin-binding growth factor specific for vascular endothelial cells.";

Biochem. Biophys. Res. Commun. 161:851-858 (1999).

-I- FUNCTION: Growth factor active in angiogenesis, vasculogenesis a endothelial cell growth. It induces endothelial cell provileration, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/Fit-1 and VEGFRI/Fit-1 are very larger to the vegetal for the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        28-FEB-2003 (Rel. 41, Last sequence update)
Vascular endothelial growth factor a permeability.

Biol. Chem. 270:7717-7723(1995).

-I- FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Fit-1 and VEGFR2/Kdr receptors and to heparan sulfate and

VEGF-A164 is more basic, has heparin-binding properties although a signicant proportion remains cell-associated, freely secreted. VEGF-A188 is very basic; it is cell-ass
                                              with PIGF (By similarity).
SUBCELLULAR LOCATION: VEGF-A120 is acidic and freely secreted.
                                                                             heparin (By similarity).
SUBUNIT: Homodimer; disulfide-linked.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nalia; Eutheria; Rodentia;

FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/Fit-1 and VEGFR2/Kdr receptors and to heparan sulfate and

                                                                                                                                                                                                                                                                                                                                                                                                    IsoId=P52582-3; Sequence=VSP_004635, VSP_004636;
Note=Has been shown to exist only in qually so far;
TISSUE SPECIFICITY: Abundantly and equally expressed in h
liver. In kidney glomeruli, brain and yolk sac, VEGF-166
10-times more abundant than VEGF-190.
DEVELOPMENTAL STAGE: VEGF-166 is expressed early at day 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin (By similarity).
                                                                                                                                                                                                          retention signal.

Tucci M., Persico M.G., Acharya K.R.;

"The crystal structure of human placenta growth factor-1 (PIGF-1), a
angiogenic protein, at 2.0 A resolution.";

J. Biol. Chem. 276:12153-12161(2001).

-i- FUNCTION: Growth factor active in angiogenesis, and endothelial
cell growth, stimulating their proliferation and migration. It
binds to receptor VEGFR-1/FLT1. PLGF-2 binds neuropilin-1 and 2
a heparin-dependent manner:
-i- SUBUNIT: Antiparallel homodimer; disulfide-linked. Also found as
heterodimer with VEGF/VEGF-A. PIGF-3 is found both as homodimer
and as monomer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Park J.E., Chen H.H., Winer J., Houck K.A., Ferrara N.; "Placenta growth factor. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 III. These sequences were used in VEGF conjugates of the invention. In the conjugates, VEGF (or fragments of it) are linked to a targeted agent (this can be via a linker sequence), so that the conjugate binds to a VEGF receptor. Cys-modified forms of VEGF are particularly suitable for chemical conjugation to linkers and targeted agents. The conjugates are used for treating proliferation of cells bearing VEGF receptors. They can be used for treating a VEGF-mediated pathophysiological condition, including dermatological disorders with underlying vascular proliferation, solid tumours or an ophthalmic disorder of hyperproliferating blood vessels of the retina, iris, conjunctiva or vitreous humour. The conjugates can also be used for treating psoriasis, rheumatoid arthritis, skin cancers and other tumours, or

 The invention relates to a fusion protein comprising non-heparin binding vascular endothelial growth factor (VEGF) peptide portion and a non-VEGF peptide portion and a non-VEGF peptide portion beeful for promoting angiogenesis and/or bone growth in mammalian host. The fusion protein is useful for promoting angiogenesis, wound healing and bone growth. Compositions containing bone growth in promoting fusion protein can be used to treat osteoporosis, rheumatoid or osteoarthritis, to improve poor bone healing, to promote implant integration and function of artificial joints and to facilitate bone reconstruction. They can also be used to treat e.g. ulcers, lesions, injuries, burns, trauma, periodontal conditions, lacerations and other conditions. The invention is also useful in protein therapy. The present sequence is human VEGF-A receptor binding domain.
 condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy.

 AAC97991 to AAC98763 encode the human colon cancer associated proteins, CC called human colon cancer antigens, given in AAB53234 to AAB54006. The human colon cancer antigens, given in AAB53234 to AAB54006. The cc human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, CC vulnerary, nephrotropic, antiinfective and antibacterial activities, and CC can be used in gene therapy. The colon cancer antigen polymucleotides, and CC croteins and antibadies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The CC polymucleotides may be used in diagnostics and research, such as for CC chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune consoners in the colon cancer, reproductive disorders, infectious consoners, and cardiovascular disorders, reproductive disorders, infectious consoners, and cardiovascular disorders. AAC98764 to AAC98772 and AAB54007 represent sequences used in the exemplification of the present cardiovascular disorders.

 CC The present invention relates to polypeptides that bind cellular CC receptors for vascular endothelial growth factors (VEGFs), the collustrations for vascular endothelial growth factors (VEGFs), the collustrations between VEGFs and their receptors. VEGFs and their receptors vegens an important role in vasculagenesis, the development of the embryonic vasculature from early differentiating endothelial cells and angiogenesis, the process of forming new blood vessels from CC pre-existing ones. Modulators of interactions between VEGF and its CC receptors may be used to treat dysfunction of the endothelial cells CC regulatory system. Such disorders include cancers, abnormal angiogenesis, recupitors may be used to treat dysfunction of the endothelial cell CC regulatory system. Such disorders include cancers, abnormal angiogenesis, CC proliferative retinopathies, age-related macular degeneration, rheumatoid CC archivitis and psoriasis. The polypeptides of the invention exhibit unique receptor binding profiles compared to known naturally occurring VEGFs.

CC The present sequence represents the polypeptide encoded by human CC VEGF-A/VEGF-C hybrid construct clone 84-9.

Ś
 CC factor (VEGF) 110. VEGF is an angiogenic factor. VEGF proteins are used CC for the prevention or repair of injury to blood vessels or associated CC nonvascular tissues (served by the blood vessels) and for the prevention CC and repair of vascular injury associated with microvascular angiopathy, or particularly thrombotic microangiopathy. The proteins methods may also be used for the prevention and treatment of kidney diseases associated CC with injury to, or atrophy of, the vasculature of the glomerulus and CC interstitium. Conditions which may be treated include haemolytic uremic typercoagulable states, platealet activation or aggregation, thrombosis, preeclampsia, thrombotic thrombocytopenia purpura, disseminated intravascular coagulation, ischemic bowel disease, transient ischemic myocardial infarction, ischemic bowel disease, transient ischemic compositium injury, acute respiratory distress syndrome, toxic alveolar conjury, pneumonia, pulmonary emboli, birth prematurity disorders, cc wounds, allergic reactions, hypersensitivity, autoimmune diseases, organ creating focal glomeruloscelerosis, and amyloidosis.

 OM protein - protein search, using sw model
 ö
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 SEQUENCE FROM N.A.
 heparin (By similarity).
SUBUNIT: Homodimer; disulfide-linked. Also found
with PIGF (By similarity).
SUBCELLULAR LOCATION: Secreted but remains associ
 FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and

 with PIGF (By similarity).
SUBCELULAR LOCATION: VEGF121 is acidic and freely secreted.
VEGF165 is more basic, has heparin-binding properties and,
although a signicant proportion remains cell-associated, most
freely secreted. VEGF189 is very basic; it is cell-associated
after secretion and is bound avidly by heparin and the
extracelular matrix, although it may be released as a soluble
form by heparin, heparinase or plasmin.
 heparin. Neuropilin-1 binds isotorms VEGF-165 and VEGF-145. SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer

Note=Has been shown to exist only in qually so far;
TISSUE SPECIFICITY: Abundantly and equally expressed in heart and liver. In kidney glomeruli, brain and yolk sac, VEGF-166 is 5- to 10-times more abundant than VEGF-190.
DEVELOPMENTAL STAGE: VEGF-166 is expressed early at day 1 and is upgraded during gastrulation. Expression of VEGF-190 is detectable only from day 2.
DOWALN: VEGF-190 contains a basic insert which acts as a cell
 FUNCTION: Growth factor active in angiogenesis, vasculogenesis and the lial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin (By similarity).

SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer
 SIMILARITY: BELONGS TO THE PDGF/VEGF FAMILY OF GROWTH FACTORS.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 growth factor (FGF) and/or vascular endothelial growth factor (VEGF) and/or vascular endothelial growth factor (VEGF). The peptides are used to produce immunogenic compositions. The immunogenic composition is used for treating cancer or hyperproliferative disorders, especially haemangloma, solid tumours, blood borne tumours, leukaemia, metastasis, telangiectasia, psoriasis, scleroderma, pyogenic granuloma, myocardial angiogenesis, Crohn's disease, plaque neovascularisation, arteriovenous malformations, corneal diseases, rubeosis, neovascular glaucoma, diabetic retinopathy, retrolental fibroplasia, arthritis, diabetic neovascularisation, macular degeneration, wound healing, peptic ulcer, Helicobacter related diseases, fractures, keloids, vasculogenesis, hematonnicator menstruation, placentation and productions are menstruation, placentation are secured.
 An immunogenic composition useful for treating cancer or hyperproliferative disorders comprises an immunogenic peptide fragment of fibroblast growth factor and/or vascular endothelial growth factor
 Novel receptor-mediated gene transfer systems for targeting tumour gene therapy - by binding to growth factor receptor with their terminal exogenous DNA component, used to treat e.g. malignant tumour cells and tumour vascular endotheliocytes, and in gene

The invention relates to a fusion protein comprising non-heparin binding vascular endothelial growth factor (VEGF) peptide portion and a non-VEGF peptide portion useful for promoting angiogenesis and/or bone growth in mammalian host. The fusion protein is useful for promoting angiogenesis, wound healing and bone growth. Compositions containing bone growth promoting fusion protein can be used to treat osteoporosis, rheumatoid or osteoarthritis, to improve poor bone healing, to promote implant integration and function of artificial joints and to facilitate bone reconstruction. They can also be used to treat e.g. ulcers, lesions, injuries, burns, trauma, periodontal conditions, lacerations and other conditions. The invention is also useful in protein therapy. The present sequence is human VEGF-A receptor binding domain.
 mammals
 method of the invention to create a 4-membered complex gene transfer system for targeting tumour gene therapy is formed from a 3-membered compound carrier of a ligand oligopeptide/polycationic polypeptide/endosome-release oligopeptide complex, and an exogenous DNA. The complexes are used for the treatment of cancer in the

 AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB53234 to AAB54006. The human colon cancer antigens given in AAB53234 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, intectious diseases, and cardiovascular disorders. AAC98764 b AAC98772 and

The present sequence represents native human vascular endothelial growth CC factor (VEGF) 110. VEGF is an angiogenic factor. VEGF proteins are used CC for the prevention or repair of injury to blood vessels or associated CC nonvascular tissues (served by the blood vessels) and for the prevention CC and repair of vascular injury associated with microvascular angiopathy. CC particularly thrombotic microangiopathy. The proteins methods may also be used for the prevention and treatment of kidney diseases associated CC with injury to, or atrophy of, the vasculature of the glomerulus and CC interstitium. Conditions which may be treated include haemolytic uremic syndrome, toxic shock syndrome, venom exposure, chemical exposure, CC syndrome, toxic shock syndrome, treated include haemolytic uremic contravascular coagulation, sethenic bowel disease, acute renal failure, CC intravascular coagulation, sechenic bowel disease, transient ischemic CC attacks, stroke, hypoxia or hypercapnia or fibrosis arising from lung CC endothelium injury, acute respiratory distress syndrome, toxic alveolar cinjury, pneumonia, pulmonary emboli, birth prematurity disorders, CC wounds, allergic reactions, hypersensitivity, autoimmune diseases, organ CC transplants, focal glomerulosclerosis, and amyloidosis.

 XXXXXXX
 Administering vascular endothelial growth factor (VGEF) can be used CC for treating hypertension (especially salt-dependent hypertension) CC Administration of VGEF promotes angiogenesis and/or vascular or CC capillary permeability. The method is also useful in treating CC disorders related to abnormal transport of solutes across endothelial CC cells. Such disorders include the treatment or prevention of kidney CC disease associated with impaired filtration or excretion of solutes; CC meningitis, tumour, infections, and bone growth disorders treatment or prevention of hypoxia or hypercapnia or fibrosis arising from CC accumulation of fluid secretions, and bone growth disorders treatment or prevention of fluid secretions in the lungs, e.g. acute respiratory CC distress syndrome, cystic fibrosis; treatment or prevention of cumulation including disorders arising from phenonary dysfunction arising from injury to the pulmonary conditions of common prevention of common prevention of disease arising from disordered transport of fluid and solutes across the intestinal common prevention of ascites accumulation in the peritoneum; enhancement or prevention of solute flux; preservation or enhancement of function of cefficacy of solute flux; preservation or enhancement of function of factor hyderion. The activity of VGEF as mediated by interaction conditions and treatment or traget tissues, most notably the vascular endothelium. VGEF exists as five different length monomer chains due to alternative splicing of the VGEF RNA transcript.

 The present sequence represents vascular endothelial growth factor (VEGF). The specification describes peptides which bind to an anti-VEGF antibody or which bind to a kinase domain receptor (KDR). The peptides inhibit the binding of VEGF to KDR, and inhibit binding of anti-VEGF antibody to VEGF. The peptides are useful for inhibiting angiogenesis and for treating diseases including cancer, diabetic

 cc enhancing the biological activity of a vascular endothelial growth factor (VEGF) originally having a cysteine residue at a position 116 of the 121 cc amino acid native mature human VEGF. The method comprises eliminating the cysteine residue to produce a VEGF variant. The variant is useful for conducing angiogenesis or vascular remodelling, for prevention or repair cof injury to blood vessels, where injury is associated with haemolytic cmicroangiopathy (TMA). The VEGF variant is also useful for treatment of cessential hypertension in a patient. The variant is useful for treatment of coronary artery disease and/or peripheral arterial disease, to foster myocardial blood vessel growth and to improve blood flow to the heart. It is useful for the treatment and prevention of kidney diseases associated compocardial infarction, ischaemic bowel disease, transient ischaemic convertitium and for the treatment and prevention of acute renal failure, captures, stroke, hypoxia, hypercapnia, focal glomerulosclerosis, captured or finerulonophritis, diabetes, systemic lupus erythematosus or chronic hypoxia/atrophy. It is also useful in the preservation or cenhancement of function of organ allografts and xenografts, and for treating disorders related to abnormal transport of solutes across cendothelial cells such as meningitis, tumour, infections, disorders of condothelial cells such as meningitis, tumour, infections, disorders of cendothelial cells such as meningitis, tumour, infections, disorders of cendothelial cells such as meningitis, tumour, infections, disorders of cendothelial cells capture remairs and cendothelial cells such as meningitis, tumour, infections, disorders of cendothelial cells across cendothelial cells across cendothelial cells across cendothelial cells cendothelial cells across cendothelial cells cendothelial cells across cendothelial cells cendotheli

 ransmembrane;
 L-asparagine.
PATHWAY: Glycosylation.
SUBCELLULAR LOCATION: Type I membrane protein. Endoplasmic
 nascent polypeptide chains.

CATALYTIC ACTIVITY: Dolichyl diphosphooligosaccharide + protein L-asparagine = dolichyl diphosphate + a glycoprotein with the alparagine chain attached by glycosylamine linkage to protein
 SIMILARITY: TO MAMMALIAN RIBOPHORIN I AND YEAST OST1.
 FUNCTION: Essential subunit of N-oligosaccharyl transferase enzyme which catalyzes the transfer of a high mannose oligosaccharide to an asparagine residue within an Asn-X-Ser/Thr consensus motif in
 reticulum (By similarity)
